EXPANSION JOINT

# EXPANSION JOINT

*Metallic Expansion Joint*

*Non-metallic Expansion Joint*

*Rubber Expansion Joint*

HANKOOK RASEONKWAN CO., LTD

## 9. ADDITIONAL TIPS

- 1) Do not insulate over a non-metallic expansion joint. If required, allow enough space for the tightening of loosened bolts without any access difficulties for regular inspection.
- 2) Do not weld near a non-metallic expansion joint.
- 3) Checks whether the cover material of the outdoor installed joint is resistant to ozone or sunlight. Neoprene and Chlorobutyl are recommended. Use weather resistant paint on other materials to avoid the effects by ozone and sunlight.
- 4) Check for leakage 2~3 weeks after installation. If necessary, tighten it again.  
Note: Expansion joint may be used in pipelines or equipment that transfers temperature and pressure generating gas or harmful materials. Therefore, do not install a rubber joint where checking is impossible due to difficult access. Leakage unable to be recovered must be checked for proper exhaust.

## 10. INSTALLATION OF CONTROL UNIT

- 1) Install the products provided with retaining ring in the piping section, allowing the same distance face to face, of the expansion joint.
- 2) Place the control rod plate behind of the pipe flange.  
Use bolts of sufficient length to apply the plate. The plates should be assembled at an equally spaced around the flange. Use two or more control rods in accordance with pressure and size.
- 3) Insert a control rod through the plate hole. Positioned a steel washer outside the plate. For additional rubber washers, assemble them between the plate and steel washers.
- 4) Fasten a nut, considering the proper distance between washers and nuts for the extension range of the product. Apply tack welding or bind it with wire to avoid unfastening of a nut. Tightening nuts are also available.
- 5) Install pipe sleeve by using normal pipe as long as product's compression.
- 6) The control rod for reducer type product should also be parallel to pipes.

## 11. INSTALLATION LOCATION

The expansion joint should always be installed in an accessible location to allow for future inspection or replacement.

Go Together  
with Hankook Raseonkwan  
to the future  
Through a Challenge without  
Cease & Technical Innovation.

# THE DEFINITION OF BELLOWS

## ■ Operation mechanism of bellows

Bellows are a flexible piping element. The corrugation of the expansion joint is designed to be flexible in order to absorb pipe expansion and contraction due to changes in temperature. The number of corrugation of bellows is decided according to the displacement amount and the expansionary and contracting force that the bellows have to absorb. Bellows have to be strong to the design pressure and operating pressure of piping and installation and they also have to be flexible to absorb thermal movement. The thrust force of the flow in the piping has to be buttressed by things other than bellows. These are usually anchors, tie rods, hinges, or gimballed structures.

The value of the thrust force of bellows is usually calculated by multiplying the value of the effective cross section area by the value of the flow pressure of pipe.

There are three kinds of bellows movements: Axial Movement, Lateral Movement, and Angular Movement. The diagrams for the movements are as follows.

## ■ Why the expansion joint required.

While designing energy pipelines, a main artery of the modern industry, planners always face many obstacles: the expansion and contraction of pipes caused by temperature changes both external and internal, vibrations generated from machine operation and other stress imposed on the pipelines by wind or in some cases by earthquake. Therefore, protection from these hazardous elements is always of major interest to the pipeline engineers.

To absorb pressure from expansion, contraction and the vibration of pipes, flexibility is key. One of the most effective flexible elements is the metallic bellows-type expansion joint, which is currently widely used due to continued developments and improvements in the performance and design technique.

## ■ Various forming methods of bellows.

Metal bellows are manufactured by piping made of thin metal plates. The following are several types of forming methods.

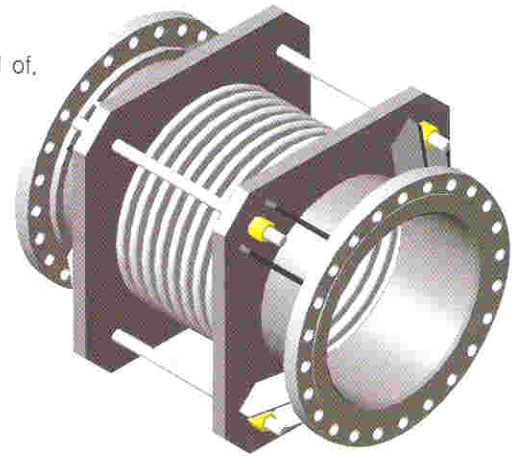

- 1) **Hydraulic forming** : uses pressure from water or oil to mold.
- 2) **Roll-forming** : presses rollers inside and outside of the pipe alternatively to create waves.
- 3) **Rubber forming** : forming by doughnut shaped rubber at the inner parts of piping for bellow in the axial direction.
- 4) **Press forming** : widely used method for forming square type expansion joint is to form it by pressing materials for bellows with mold.

# THE COMPOSITION OF A BELLOW TYPE EXPANSION JOINT

## ■ Parts and components

The picture below shows how a bellows type expansion joint is composed of.

\* Various types of control ring

## ■ Parts and features of expansion joint.

1) **Bellows** : After piping with high-quality stainless steel plates or alloyed steel sheet, bellows are produced through hydraulic forming or roll forming. And sometimes the bellows are heat treated to eliminate the remaining welding stress on the welding part or to remove the remaining stress generated during forming.

2) **End pipe** : To facilitate connecting and fitting into the ends of bellows, the end pipe is normally made with the same material that is used for the pipeline, and also to the same size as the pipeline.

3) **Control-ring** : The control ring is applied to bellows that are used for pipelines under high pressure. Installed on the convoluted parts of bellows, it reinforces the strength of bellows against high-pressure. It can be manufactured in a variety of forms according to the level of pressure.

4) **Internal Sleeve** : A device which minimizes contact between the inner surface of the bellows of an expansion joint and the fluid flowing through it. It prevents vibration, and erosion of the bellows.

5) **Flange** : Customers can choose a flange standard from among KS, JIS, ANSI, and DIN.

6) **Tie rod** : Tie rods protect a device from excessive stretching and prevent the dislocation of pipelines. They also stabilize pipelines by absorbing thrusts.

7) **Set bolt** : Set bolts are used to maintain "face to face" dimension, while shipping or installing, and are removed after installation is complete.

## PRODUCT MODELS AND FEATURES

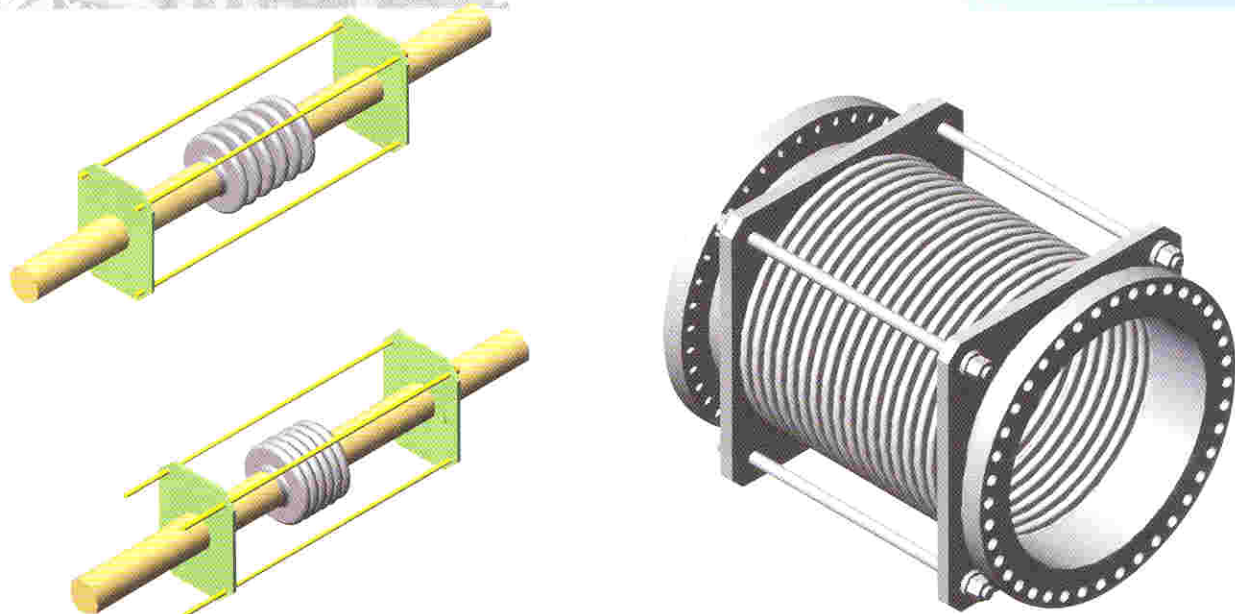

### ■ SINGLE TYPE EXPANSION JOINT-UN TIED (MSN)

The simplest form of expansion joint, of single bellows construction, designed to absorb all of the movements of the pipe section in which it is installed. According to operated pressure of a device, this model is manufactured with or without the shrink ring.

### ■ SINGLE TYPE EXPANSION JOINT- TIED (MST)

This model, with the tie-rod assembly, is an improvement on the Single Type Expansion Joint. This model is designed for pipelines with lateral movements. Tie-rods are designed to sustain the thrust generated during operation.

## ■ UNIVERSAL TYPE EXPANSION JOINT-UN TIED (MUN)

A universal expansion joint contains two bellows joined by a intermediate pipe for the purpose of absorbing any combination of the three basic movements, i.e. axial movements, lateral deflection, and angular rotation.

This model is used for pipelines with bigger lateral movements than the single type.

## ■ UNIVERSAL TYPE EXPANSION JOINT-TIED (MUT)

This model, with a tie rod assembly, is an improvement on the un-tied universal type. The tie rod absorbs the thrust, which may damage the device.

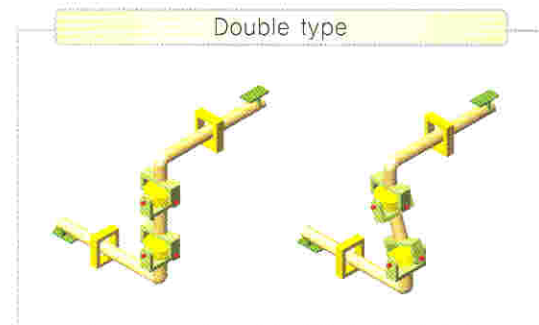

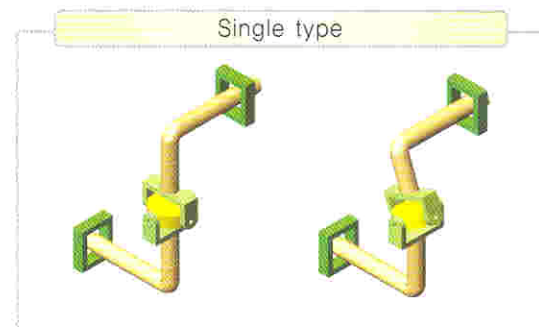

## ■ HINGE TYPE EXPANSION JOINT (MSH)

A hinged expansion joint contains one bellows and is designed to permit angular rotation, by the use of a pair of pins through hinge plates attached to the expansion joint ends. The hinge arms and hinge pins must be designed to restrain the thrust of the expansion joint due to internal pressure. Hinged expansion joints should be used in sets of two or three to function properly.

## ■ GIMBAL TYPE EXPANSION JOINT (MSG)

A gimbal expansion joint is designed to absorb combined movements by the use of two pairs of gimbal arm and gimbal pin, which restrains the thrust of the expansion joint due to internal pressure while the bellows is designed to absorb angular rotation only. Gimbal expansion joints should be used in sets of two or three to function properly just like hinged expansion joints.

## ■ PRESSURE BALANCED TYPE EXPANSION JOINT (MSB)

If the diameter of the pipe is excessively large or high pressure is running in the pipes, anchors must be installed to restrain the thrust of the expansion joint. However when conditions would not allow the installation of anchors, this pressure balance type expansion joint has to be used. According to the location of installation, L type (MSB-Bent Pipe Balanced) or S type (MSS-Straight Pipe Balanced type) is used.

"L" type PRESSURE BALANCED EXPANSION JOINT

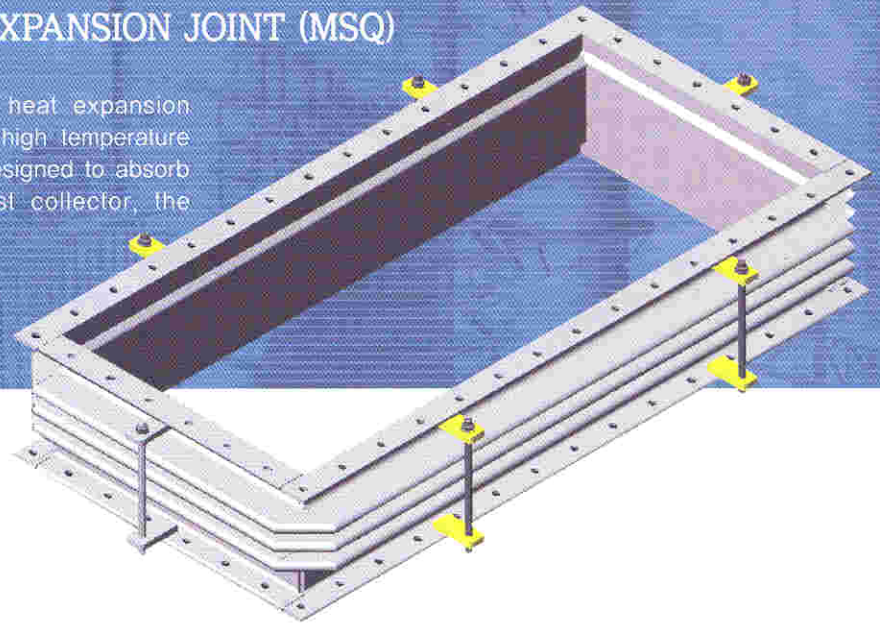

"S" type PRESSURE BALANCED EXPANSION JOINT

## ■ RECTANGULAR TYPE EXPANSION JOINT (MSQ)

This product is designed to absorb heat expansion around large-scale rectangular line of high temperature and low pressure. This model is also designed to absorb movements and vibration of the dust collector, the exhaust duct, and the ventilator.

1) **CORNER type** : There are five corner types; Single miter, Round, Double miter, Camera, and Box Single Miter

Single Miter Corner

Round Corner

Double Miter Corner

Camera Corner

Box Single Miter Corner

2) **Corrugation shape** : There are two types of bellows: U-shaped and V-shaped

"U" Profile

"V" Profile

## ■ EXPANSION BELLOWS FOR HEAT EXCHANGER

The expansion bellows for heat exchanger is used to restrain the heat stress, which is generated by temperature difference between the heat exchanger shell and the tube.

Installed on the shell of the heat exchanger, the bellows prevent the heat stress from reaching the body or the tube.

Cross-section of the product

## 크로스오버 파이프의 일반 사양

크로스오버 파이프는, 스팀터빈장치가 있는 IP(또는 HP) CASING에서 LP HOOD로 스팀을 이동시키는 용도로 사용된다. 터빈과 CASING사이의 THERMAL MOVEMENT가 다르기 때문에 적당한 유연성을 지녀야 한다. 또한, 운전시 스팀압력에 대한 안정성을 갖춰야 한다.

### 설계 조건

- 온도 : up to 380 °C
- 압력 : 10 kg/cm<sup>2</sup>

### 규격

- From 48" to 84" Diameter.
- Expansion Joint Type : Pressure Balanced type-Elbow

### 재질

- Bellows : ASTM A240-316 (or SUS 316)
- Body : Carbon Steel (JIS or ASTM)
- Flange : ASTM A105 (or SF440A)
- Tie Rod : ASTM A 193-B7 (or SCM435)

※ 벨로우즈 성형방법 : 액압성형

### Design Code

- ASME B31.1 Power piping
- ASME Section VIII, Pressure vessel
- PED 97/23/EC, European Pressure Equipment Directive
- EJMA, Expansion Joint Manufacturers Association

# LNG Carriers EXPANSION JOINTS

HKR designs & manufactures a wide variety of bellows type expansion joints rating from 3/8" to unlimited size of nominal diameter in accordance with the EJMA, ASME, IGC, GTT and special code required from customers. Our products for LNG Carriers are inspected and certified by Lloyd's Register, ABS, DNV of Shipping.

HKR a wide range of standards expansion joints for all kinds of applications

Type : HS-Single Free Style

Type : HU-Universal Free Style

Type : HU-Tie Rod Style

Type : HU-Tie Rod Style

Type : HU-Hinge Style

Type : HU-Hinge Style

Type : HU-Hinge Style

## Our metal bellows program for LNG

- from DN 6 to 2100
- single or multi-ply construction
- made of ductile and malleable materials
- assemblies produced by welding, brazing, soldering and gluing with standard fittings or according to customer's specification.

- HKR metal bellows offer a solution to your technical problems
- for flexible connections
- for glandless sealing
- to absorb vibrations
- to accommodate build tolerances
- as a pressure accumulator
- as a control element

LIFE CYCLE TEST

FATIGUE TEST

BURSTING TEST

HYDRO TEST

# GIS & PRECISION BELLOWS

## Bellows for GIS (SF6 GAS Insulated Switchgear)

Expansion bellows used for the GIS device absorbs the shock generated during switching on and off. This bellows also permits changes in shape and length due to fluctuations in temperature while absorbing movements due to repair, reassembly or earthquake.

**Applications :** products with the voltage range listed below

25.8kv, 72kv, 84kv, 145kv,  
170kv, 362kv, and 600kv

## PRECISION BELLOWS

Hankook Raseonkwan's precision bellows are used for devices and valves requiring high precision and leakage protection.

**Applications:** Bellows sealed valve, vacuum interrupter, industrial auto controller, and others.

Design Cycles : The above movement value is based on 3000 cycles.

Weight : For models of lower than 600A, ANSI#150 flange is included, while for models of higher than 650A, flange is not included.

\* We can manufacture products different from the above specifications if customer's request.

## ■ MSG (Single Guide Rod Type)

**Applications** : gas pipes, ventilators, low-pressure steam pipes, and others

**Pressure limits** : 1kg/cm<sup>2</sup>~2kg/cm<sup>2</sup>, less than 5kg/cm<sup>2</sup>, less than 10kg/cm<sup>2</sup>

Weight : For models of lower than 600A, ANSI#150 flange is included, while for models of higher than 650A, flange is not included.

☞ We can manufacture products different from the above specifications if customer's request.

## ■ Materials applied according to use conditions of each expansion joint component

※ Classification based on temperature

Part	Temp.	-200℃~-20℃	-20℃~350℃	350℃~450℃	450℃~600℃
Flange		STS304	SS400, S25C	SF45, F-12	F-12
Pipe		STS304	SS400,SGP,STPG	STPG, SB410	STS304, STS321
Stiffener		STS304	STS400	SB410	F-12
Bellows		STS304	STS304	STS316	STS321
Control ring		STS304	SS400,SC20	SS400, SC20	STS304
Tie rod		STS304	SC20, SCM3	SCM-3	STS304,SCM-3
Sleeve		STS304	SS400	SB410	STS304STS304

※ Material applied according to type of fluid

Type of fluid	Temp.	30℃	Intermediate Temp.	Near boiling point
Nitric acid		STS304	STS304	STS304
Sulfuric acid		STS316	INCOLOY 825	INCOLOY 825
Sulfurous acid		STS316	STS316	INCOLOY 825
Acetic acid		STS304, STS316	STS316	STS316L
Phosphoric acid		STS304	STS316	INCOLOY 825
Hydrochloric acid		STS316	INCOLOY 825	-
Alkali		STS304	STS304, STS304L	STS304L
Ammonia		STS304	STS304, STS304L	STS304L
Brine		STS316	M-5	INCOLOY 825

# FLEXIBLE JOINT

## ■ Composition of a flexible hose

A flexible hose is generally composed of metal hose, braids, and end fittings such as unions, flanges, nipples, and sockets.

### 1) Metal hose

Made of stainless steel strips, metal hoses are highly elastic. Corrugated forming methods enhance metal hoses' flex resistance and flexibility, reducing vibration at joints of mobile devices and vibration piping. We manufacture high quality metal hoses by comprehensively processing stainless steel strips with the automatic forming machine and then heat-treating them in the automatic continuous bright annealing furnace. There are two types of metal hoses: spiral type, which is suitable for general use under medium pressure and annular type, which is suitable for use under high pressure.

### 2) Braid

When fluid pressure is under work inside the metal hose, the hose stretches length-wise. Should this occur, the braid restrains stretching and protects the metal hose from external shock. Hankook Raseonkwan's hoses are manufactured with stainless steel wire up to 200A. When manufacturing a braid, we always consider working pressure and temperature.

### 3) End Fitting

Flexible hoses are usually fixed by welding end fittings to the ends of metal hose. The welding part is weaker at corrosion than parent material because of heat stress. To address this problem, we manufacture flexible hoses to be as simple as possible to facilitate welding and assembly.

## ■ Types of Connection

### SM type

Nominal diameter	T	D	l	H
8A	PT 1/4	7	27	17
10A	PT 3/8	9	28	21
15A	PT 1/2	19	33	26
20A	PT 3/4	19	36	32
25A	PT 1	24	42	38
32A	PT 1,1/4	32	44	46

350A	1500				33	55	65	145	190	300	480

※ We can manufacture products different from the above specifications if customer's request.

## ■ Flexible Joint-FJM

### Features

Manufactured by special bellows developed in Korea, this joint is small but flexible, absorbing vibrations at the joints, which connect small pipes to the device. They are usually used in connecting pumps and pipes.

### Specifications

Flange : Carbon Steel, Stainless Steel

Bellows : Stainless Steel 304

Braid : Stainless Steel 304

### ※ Flexible joint specifications

Nominal Dia. (N.D)	Length (mm)	Braid Type	Max. Working Pressure (kg/cm <sup>2</sup> )		Weight (kg)
			Single Braid	Double Braid	
25A	200	Stainless Wire S/S 304	24	45	4

300A	350		10	184	70

※ We can manufacture products different from the above specifications if customer's request.

## ■ Pump connector for absorbing vibration (TTC)

### Features of pump connector for absorbing vibration

- Increased reliability by using multi-ply bellows
- No transmission of vibration due to the braid
- No friction noise generated because the tie rod absorbs thrusts and the rubber washer is used.
- Easy to install and replace this connector because two tie rods are used.
- Vibration condition : Axial  $\pm 3\text{mm}$ , Lateral  $\pm 3\text{mm}$

### \* Specifications for TTC (for 10kg/ cm<sup>2</sup>)

Nominal diameter (N.D)	Connection (Flange)	Overall length (mm)	Weight (kg)	Movement (mm)			Material

# INFORMATION ABOUT NON-METALLIC EXPANSION JOINT

## Definition of Product

The non-metallic expansion joints are flexible connectors designed to eliminate the thermal stress created by absorption of displacement from thermal changes in ducting systems. It also absorbs vibrations and compensates for minor installation errors in its ducting or equipment. They are fabricated from a wide variety of non-metallic materials, including synthetic elastomers, fabrics, insulation materials and fluoroplastics, depending on the designs.

## Major Applications

The range of use for non-metallic expansion joints has widened since its introduction in the early sixties. The stricter environmental regulations have resulted in the development of more sophisticated duct systems, requiring non-metallic expansion joints to solve those problems caused by the thermal and mechanical stresses generated in these complex systems.

Although the major user of the non-metallic joint continues to be the power generation industry, the use of this product has expanded into virtually every industry, which conveys gases. A partial list of those industries is as follows:

- |                          |                      |                                  |
|--------------------------|----------------------|----------------------------------|
| 1) Power generation      | 3) Refineries        | 7) Refuse Incineration           |
| - Fossil Fired Plants    | - Petroleum industry | 8) Marine                        |
| - Gas Turbine Plants     | - Chemical equipment | 9) Food Processing               |
| - Cogeneration Plants    | 4) Steel Mills       | 10) HVAC-Heating,                |
| - Nuclear Power Plants   | 5) Smelters          | Ventilating and Air Conditioning |
| 2) Pulp and Paper Plants | 6) Cement Plant      |                                  |

# STRUCTURE OF NON-METALLIC EXPANSION JOINT

- A. Gas Seal Membrane** — The gas seal membrane is intended to withstand system pressure and be resistant to chemical attack from the interior and the exterior. The gas seal must also have the flexibility to absorb thermal movements. Depending on system temperature, it may or may not require additional thermal protection.
- B. Insulating Layer** — The insulating layers provide a thermal barrier to ensure that the inside surface temperature of the gas seal membrane does not exceed its maximum service temperature. The insulating layer can also reduce condensation caused by the gas stream coming in contact with the “cool” surface of an un-insulated gas seal membrane.
- C. Insulating Retainer Layer** This layer is provided solely to keep the insulating layers in place in order to maintain thermal integrity. The retaining layer must be capable of withstanding gas stream temperatures and must be chemically compatible with system media.
- D. Back-Up Bars** — A back up bar, positioned at the flange attachment, uses clamping pressure to create the fabric-to-duct seal and restrains the fabric when it is subjected to the system pressure. The thickness and width of the back up bar should be sufficient to perform this function with the bolt spacing being used. The edges of the back up bar should have a radius to preclude cutting of the fabric.
- E. Metal Liner** — A liner designed to protect the gas seal membrane and insulating layers of the flexible element from abrasive particles, which may be present in the gas stream. A liner is also used to reduce flutter of the fabric element caused by turbulence, to help control the accumulation of duct or ash in the expansion joint cavity, and to reduce the temperature of the flexible element.
- F. Accumulation Bag** — An accumulation bag is intended to deter fly ash from building up in the expansion joint cavity. It is typically used, in conjunction with a liner, in duct runs from boilers to air clean-up equipment such as precipitators, scrubbers and bag houses, or whenever high amounts of dust or ash are present in the gas. A fly ash barrier must be capable of retaining its strength and flexibility while being exposed to maximum system temperatures and media.
- G. Metal Frame** — Fabric attachment flanges are required to connect the flexible element to duct work. Properly designed, they can be attached directly to the duct work and thus eliminate the necessity for an adjoining duct flange. Flanges can be designed with a “landing bar” duct attachment, which allows some installation misalignment without affecting the flexible element. The flanges establish the stand off height of the fabric, which is necessary to achieve thermal integrity during all movement conditions. The edges of the flanges in contact with the Gas Seal Membrane should also have a radius to prevent damage.
- H. Gasket or Cuff** — Fabric belts with insulating layers require a special thermal insulating gasket to protect fabric components from hot attachment flanges and back up bars. Low temperature, single ply belt designs require flexible, chemically inert gasket.

# APPLICATION FOR NON-METALLIC EXPANSION JOINT

## APPLIED INDUSTRIES

### APPLICATIONS

Economizer to Air Heater  
 Gas Recirculation to Boiler  
 Air Heater to Precipitator  
 Recovery Boiler to Precipitator  
 Turbo-Expander to CO Boiler  
 CO Boiler to Precipitator

### SYSTEM DESIGN CONSIDERATIONS

**Temperature:**

700°F~900°F for continuous operation, excursions to 1200°F

**Media:**

Low pH Flue gas from the combustion of coal, oil, or caustic black liquor;  
 Flue gas from regeneration process.

**Particulate:**

Transferred with heavy fly ash from coal combustion, salt cake from black liquid fuel or catalyst carryover from the FCCU unit at a Refinery.

**Insulation / Lagging:**

Do not lag over the expansion joint. Also, remove lagging back away from the flanges to allow radiant cooling.

**Pressure:**

Slightly negative for balanced draft boilers, otherwise positive pressure as much as 40-50 inches water gage. Low pressure off the Turbo-Expander.

**Operating Conditions:**

Systems usually on line for 12 to 18 months. Refineries have longer durations between major outages. Only Power 'peaking' plants will cycle more frequently.

**Movements:**

Ductwork/boilers generally have large expansions and require joint system with large lateral and compression capabilities.

## DESIGN APPLICATIONS

Note: Above design is available for all applications. Different types of main body structures are available according to user's duct installation conditions.

## COMPONENTS AND FEATURES

### A Belt

High performance gas seal membrane  
Heat Seal Splice  
Flexibility for large movements  
High tensile for particulate build up.  
Repairable  
Assembled by heating.

### B Insulation

Formed by needle insulation blanket.  
Reinforced with wire mesh  
Must not allow temperature to exceed belt maximum.

### C Accumulation Pillow

Reduce Fly ash build up in Cavity

### D Radiused Back-Up Bar and Frame Edges

Protects belt from damage

### E Telescoping Lingers

Shortens installation period.  
Eliminates direct impingement (abrasion)  
Reduces temperature at the belt element

### F Cuff-Flange insulation

Produced with woven glass fiber tape.  
Protects a belt from high hot flange and back-up bar.

### G Outboard Flanges

Allows radiant cooling  
Lower cost belt installation

## GAS SEAL MATERIAL CONSIDERATION

Wet/dry media	Optional chemical resistant barrier is not required since the system maintains temperatures greater than dew point so that fluids do not produce moisture while operating. Regular operation may cause corrosive condensate. Chemical resistant barrier prevents corrosion.
Flutter	Eliminate the possibility of the mechanical damage due to flutter by using a composite design of bellows and accumulation pillow.
Pressure	Continuous pressures below 50 inches water gauge do not require special belt construction.
Abrasion	Above design avoids the direct effects of fly ash, salt cake or catalyst that will be present.
Gas / Air	Combustible gasses are produced by the combustion of fossil fuel or black liquid fuel, creating highly corrosive condensation.

# APPLICATION FOR NON-METALLIC EXPANSION JOINT

## APPLIED INDUSTRIES

### APPLICATIONS

Air Heater to Fossil Fired Boiler  
Air Heater to Coal Mills.

### SYSTEM DESIGN CONSIDERATIONS

**Temperature:**

600° F~750° F for continuous operation

**Media:**

Clean ambient air pushed from the FD Fan and from the Primary Air Fan thru the Air-heater to the Boiler both directly and thru the mills

**Particulate:**

Clean Air

**Insulation / Lagging:**

Do not lag over the expansion joint. Also, remove lagging back away from the flanges to allow radiant cooling.

**Pressure:**

Positive 5" water to as high as 80" of water for positive pressure boilers.

**Operation:**

After start up movement is nominal. Severe high pressure operating conditions may be experienced in the Primary Air Ducts of Positive Pressure Boilers.

**Movements:**

Moderate high temperatures will generate moderate compressive and movements when the unit is on line. Each change in direction in the ductwork will generate a resultant lateral offset.

## DESIGN APPLICATIONS

Note: Above design is available for all applications. Different types of main body structures are available according to user's duct installation conditions.

## COMPONENTS AND FEATURES

### A Belt

High performance gas seal membrane  
Heat Seal Splice  
Flexibility for moderate movements  
Repairable

### B Insulation

Formed by needle insulation blanket.  
Reinforced with wire mesh  
Must not allow temperature to exceed belt maximum.

### C Flow Liner

Increase Service Life  
Outage personnel safety

### D Radiused Back-Up Bar and Frame Edges

Protects belt from damage

### E Outboard Flanges

Allows radiant cooling  
Lower cost belt installation  
Easier belt access

### F Cuff-Flange Insulation

Produced with woven glass fiber tape.  
Protects a belt from high hot flange and back-up bar.

## GAS SEAL MATERIAL CONSIDERATION

Wet/dry media	Since temperatures are well above flue gas dew point temperature during continuous system operation the media will be dry and membranes without chemical film barriers may be used.
Flutter	Composite type of belt structure is inherently rigid enough to eliminate the possibility of mechanical damage due to flutter.
Pressure	No special belt design is required for continuous operation pressure below 50 inches water gage. However, if it is a positive pressure boiler, pressure may reach 75" to 80" of water resulting in the need for higher strength materials.
Abrasion	None
Gas / Air	The media is clean air drawn from the Fan thru the Air-heater to Boiler and the Mills.

# APPLICATION FOR NON-METALLIC EXPANSION JOINT

## APPLIED INDUSTRIES

### APPLICATIONS

Primary Air Fan to Air Heater  
 FD Fan Air to Air Heater  
 Primary Air to Recovery Boiler  
 Ambient Air to Turbine  
 FD Fan Air to Recovery Boiler

### SYSTEM DESIGN CONSIDERATIONS

**Temperature:**

Ambient air, -20°F~120°F

**Media:**

Ambient air

**Particulate:**

None

**Heat Insulation and Insulation:**

Heat insulation and insulation can be used on the outside of the product in the case of low operating temperatures.

**Pressure:**

Positive pressure, 40~50 inches water gauge or higher.

Turbine air inlets are slight negative pressure. Outlet at fans may produce pressure pulsations and/or extreme turbulence.

**Operation:**

Operational conditions have little effect on the airside ducts. Cyclical conditions and dew point have little effect as well.

**Movements:**

Joints at boilers subject to large movements. Fan outlet joints see little movement, primarily vibration.

## DESIGN APPLICATIONS

Note: Above design is available for all applications. Different types of main body structures are available according to user's duct installation conditions.

## COMPONENTS AND FEATURES

### A Belt

Gas Seal membrane  
 Moderate Flexibility  
 Medium Tensile Strength  
 Heat Seal  
 Repairable

### B Flow Liner

Increases product's service life.  
 Outage for personnel safety.

### C Radiused Back-Up Bar and Frame Edges

Prevents the damage to the belt.

### D Outboard Flanges

Easy access reduces installation and replacement labor cost

### E Gasket

Prevents gas leakage.  
 Easy to installation  
 Optional for some gas seal membranes

## GAS SEAL MATERIAL CONSIDERATION

Wet/dry media	Dry ambient clean air
Flutter	Direct air impingement is likely at the Primary Air Fan Outlet and at the FD Fan Outlet.
Pressure	Continuous positive pressure rating from 30 inches to 90 inches water gauge. Some gas seal membranes may require special belt construction. Turbine air inlet slightly negative and constant.
Abrasion	None
Gas / Air	Ambient air usually contains no contaminants that may be harmful to the gas seal membrane.

# APPLICATION FOR NON-METALLIC EXPANSION JOINT

## APPLIED INDUSTRIES

### APPLICATIONS

Re-Heater to Chimney  
 Precipitator to Induced Draft Fan  
 Induced Draft Fan to Chimney  
 Induced Draft Fan to Scrubber  
 Steam Generator to Stack  
 Precipitator to Chimney

### SYSTEM DESIGN CONSIDERATIONS

#### Temperature:

Continuous operation temperature, 350°F~500°F

#### Media:

Flue gas from precipitator drawn by Induced Draft Fan; Scrubbed Flue gas from Re-Heater going to Chimney. Turbine Exhaust Gas from Heat Recovery Steam Generator to Chimney.

#### Particulate:

Minimal before scrubber systems, negligible after scrubber systems.

#### Insulation / Lagging:

Temperatures allow lagging over the expansion joints without adverse effects.

#### Pressure:

-15"wg after precipitators and +15"wg after I.D fan

The ducts of scrubbers and steam generator ends are affected by the pressure -5~+5"wg.

#### Operation:

Although movements are not severe temperatures will approach dew point present potential corrosion problems.

#### Movements:

Moderate compressive and lateral movements expected depending on ductwork configuration and length. Fan Joint usually see minimal movements.

## DESIGN APPLICATIONS

Note: Above design is available for all applications. Different types of main body structures are available according to user's duct installation conditions.

## COMPONENTS AND FEATURES

### A Belt

High performance gas seal membrane.  
Heat Seal Splice (No vulcanization)  
Flexibility for moderate movement.  
Repairable

### B Flow Liner

Increases product's service life.  
Outage personnel safety

### C Radiused Back-Up Bar and Frame Edges

Prevents the damage to the belt.

### D Outboard Flanges

Easy access reduces installation and replacement labor cost.

### E Gasket

Prevents gas leakage.  
Easy to installation.  
Selectively used according to the gas seal material in a belt.

## GAS SEAL MATERIAL CONSIDERATION

Wet/dry media	Since temperatures are above the flue gas dew point, media will dry during continuous operation. Membranes without chemical barrier may be used. If changes in system operation or frequent outages cause wet, corrosive conditions, an optional chemical barrier should be considered.
Flutter	Direct flue gas impingement is likely at the induced Draft Fan Outlet.
Pressure	The pressure range of continuous operation is under 50"WG, and a special stiffening structure is not necessary. However, if it is a positive pressure boilers, pressure may reach 75~80" of water resulting in the need for higher strength material.
Abrasion	None
Gas / Air	The combustion gas produced by fossil fuel or black liquid fuel creates corrosive condensate. Turbine exhaust is clean and non-corrosive.

# APPLICATION FOR NON-METALLIC EXPANSION JOINT

## APPLIED INDUSTRIES

### APPLICATIONS

Scrubber to Re-Heater  
 Scrubber Bypass to Scrubber  
 Scrubber Bypass to Re-Heater  
 Scrubber Outlet to Re-Heater

### SYSTEM DESIGN CONSIDERATIONS

#### Temperature:

Continuous operation temperature, 150° F~350° F

#### Media:

Dry flue gas to scrubber or bypass pushed by Induced Draft Fan; Wet flue gas at scrubber inlet; Wet, scrubbed flue gas from Scrubber (flue gas desulfurization) going to Reheater.

#### Particulate:

Minimal before scrubber systems, negligible after scrubber systems.

#### Insulation / Lagging:

Temperatures allow lagging over the expansion joints without adverse effects.

#### Pressure:

Positive after the Induced Draft Fan, as much as 15" wg. Slightly negative, -5"wg. to slightly positive, +5"wg after Scrubber depending on unit load and weather conditions.

#### Operation:

Although movements are not severe temperatures will approach dew point and present potential corrosion problems. Wet Scrubber Service is potentially highly corrosive.

#### Movements:

Small movements expected.

## DESIGN APPLICATIONS

Note: Above design is available for all applications. Different types of main body structures are available according to user's duct installation conditions.

## COMPONENTS AND FEATURES

### A Belt

Chemical resistant barrier.  
High performance gas seal membrane.  
Heat Seal Splice (No vulcanization)  
Flexibility for moderate movements  
Repairable

### B Flow Liner

Increases product's service life.  
Outage for personnel safety

### C Radiused Back-Up Bar and Frame Edges

Prevents damage to the belt.

### D Outboard Flanges

Easy access reduces installation and replacement labor cost.

### E Gasketing

Chemical resistance required  
Prevents gas leakage.  
Easy to installation

## GAS SEAL MATERIAL CONSIDERATION

Wet/dry media	Temperatures are in or near the flue gas dew point; media will be wet during continuous operation. Membranes with chemical barrier should be used.
Flutter	Partially open Bypass damper or changes in direction of ductwork may create excessive gas stream turbulence resulting in direct flue gas impingement.
Pressure	Varies from positive to negative depending on system operation. Membrane may see more flexing than other applications. Good flexibility needed.
Abrasion	None
Gas / Air	Gas streams from fossil fuel or black liquor combustion processes may create corrosive condensation.

# APPLICATION FOR NON-METALLIC EXPANSION JOINT

## APPLIED INDUSTRIES

### APPLICATIONS

Diverter Bypass to Stack  
Diverter Exhaust to HRSG

Turbine Exhaust to Diverter Inlet  
Turbine Outlet Stack

### SYSTEM DESIGN CONSIDERATIONS

#### Temperature:

Continuous operation temperature, 1000°F~1200°F, excursions to 1350°F.

#### Media:

Turbine Exhaust Gas from combustion of natural gas or fuel oil. Dry and non-corrosive.

#### Particulate:

None

#### Insulation / Lagging:

Do not lag over the expansion joint. Also remove lagging back away from the flanges to allow radiant cooling.

#### Pressure:

Constant positive pressure generally no higher than 15 to 20 inches water gauge.

#### Operation:

Systems with heat recovery are usually on line for 12 to 18 months. Power 'peaking' plants may cycle frequently as much as once per day.

#### Movements:

Ductwork/ equipment expansions are large due to the temperature. Generally, lateral movements are small due to short, direct ductwork runs.

## DESIGN APPLICATIONS

Note: Above design is available for all applications. Different types of main body structures are available according to user's duct installation conditions.

## COMPONENTS AND FEATURES

### A Belt

High performance gas seal membrane.  
Heat Seal Splice  
Flexibility for large movements  
Repairable

### B Insulation

Formed by needle insulation blanket.  
Reinforced with wire mesh.  
Must not allow temperature to exceed belt maximum

### C Insulation Pillow

Critical for reducing cavity temperatures  
High performance insulation blanket  
Wire mesh/silica cloth cover for long life integrity

### D Radiused Back-Up Bar and Frame Edges

Prevents damage to the belt.

### E Outboard Flanges

Allows radiant cooling  
Lower cost belt installation

### F Cuff

Made of woven glass fiber tape.  
Protects a belt from Hot Flange and Back-Up Bar.

### G Telescoping Lingers

Required to install an insulation pillow properly.  
Dampens turbulence reduces temperature at the belt element

## GAS SEAL MATERIAL CONSIDERATION

Wet/dry media	Generally dry and non-corrosive. Extreme turbulence is generated near the turbine outlet.
Flutter	The composite belt design, insulation pillow and telescoping liners sufficiently dampen turbulence pulsations.
Pressure	Continuous pressure below 50 inches water gauge does not require special belt construction.
Abrasion	None
Gas / Air	Gas streams from Turbine combustion usually have no chemical effects on gas seal membranes. However, with the increased importance of emissions control, chemical additives to the turbine combustion process may require chemically resistance gas seal membranes.

# COMPARISON OF NON-METALLIC AND METALLIC PRODUCTS

## Advantages of Non-Metallic Expansion Joint

- 1) **Large movements:** The non-metallic expansion joint offers multi-plane movement in a shorter face-to-face dimension.
- 2) **Low load:** Very small reaction force created by expansion amount.
- 3) **Corrosion Resistance:** Able to be used with a wide variety of elastomers, fabrics and fluoroplastics.
- 4) **Sound and Vibration elimination:** Superior reduction of vibration and noise.
- 5) **High Temperature Resistance:** Available for operating temperatures up to 2000°F.
- 6) **Cost Effective:** Cost effective design, reduction in number of devices and simple system structure
- 7) **Economical Material Cost:** Easy to apply non-corrosive materials.
- 8) **Cost Effective Transportation and Installation:** Lightweight and minimal field assembling cost.
- 9) **No Need for Gasket:** Product itself is a gasket.
- 10) **Economical Replacement Cost:** The time required for replacement is short.

## Advantages of Metallic Expansion Joint

- 1) **High Pressure Capability:** Can be used in high-pressure conditions.
- 2) **Low Temperature Application:** Can withstand large temperature extremes, including cryogenic.
- 3) **Fluid Transfer:** Can be designed for liquid or gaseous media
- 4) **Perfect Sealing:** Perfect sealing of gas or fluid
- 5) **Non-combustible**
- 6) **No Need for Maintenance & Repair:** Additional maintenance & repair is not necessary.

# EXPANSION JOINT DESIGN

## Movement Conditions

### 1) Type of Movements

- Axial Compression: The dimensional shortening of the expansion joint face-to-face gap parallel to its longitudinal axis.
- Axial Extension: The dimensional lengthening of the expansion joint face-to-face gap parallel to its longitudinal axis.
- Lateral Movement: The dimensional displacement of the inlet and the outlet flanges of the expansion joint perpendicular to its longitudinal axis.
- Torsion Rotation: The twisting of one end of the expansion joint with respect to the other end about its longitudinal axis.
- Angular Rotation: That movement which occurs when one flange of the expansion joint is moved to a put-of-parallel position with the opposite flange.
- Vibration: The rapid, small movements, back and forth that can occur in any single plane or multi-planes.

### 2) Independent or Concurrent Movement

- Independent movement: Defined as acting along and in only one direction at one time.
- Concurrent movement: Defined as any two or more movements acting simultaneously.

### 3) Normal Operating and Excursion Movement

Consider design expansion by normal and excursion movement data.

### 4) Typical Movement Capabilities

Type	Axial Compression	Active Length	Axial Expansion	Lateral Movement
Single Layer	150mm	40mm	13mm	25mm
	230mm	75mm	13mm	38mm
	305mm	100mm	25mm	50mm
	405mm	125mm	25mm	63mm
Composite type	150mm	25mm	13mm	13mm
	230mm	50mm	13mm	25mm
	305mm	75mm	25mm	38mm
	405mm	100mm	25mm	50mm

- ❖ The active length of the flexible element is a major design consideration. In general, by increasing the active length of the expansion joint, greater movements can be accommodated.
- ❖ Above movement range is applicable only to Independent movement, and Concurrent movement follows HKR standards.

### Set-Back (Stand-Off Height)

Consider set-back (stand-off height) when you determine the outside size of a duct. Set-back refers to the height from the inside of a duct to the bellows.

### HKR Standards for Set-back (by Type/Pressure Direction)

Active Length		150mm	230mm	305mm	405mm
Set-Back	Belt Type/ Positive Pressure	75mm	75mm	100mm	150mm
	Belt Type/ Negative Pressure	100mm	150mm	150mm	175mm
	Integral Flange Type/ Positive Pressure	25mm	38mm	50mm	63mm
	Integral Flange Type/ Negative Pressure	50mm	75mm	100mm	125mm

### Face to face or brench opening

The Face-to-Face distance or Breach Opening is the distance between the mating duct flanges in which the expansion joint is to be installed.

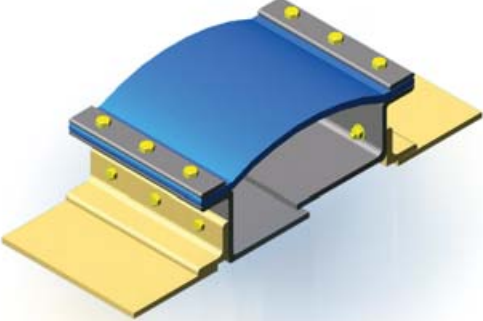

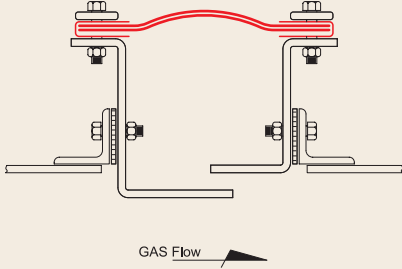

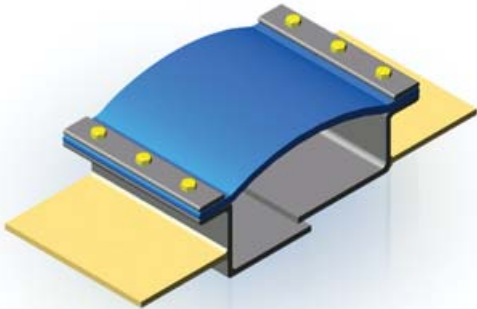

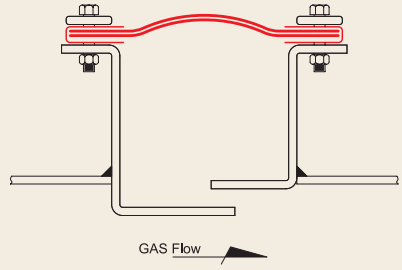

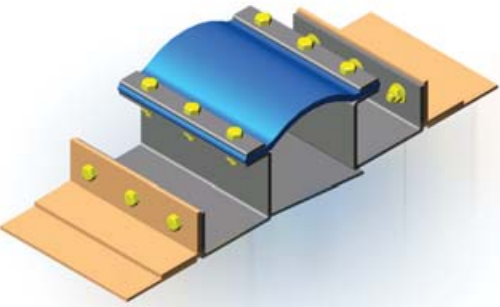

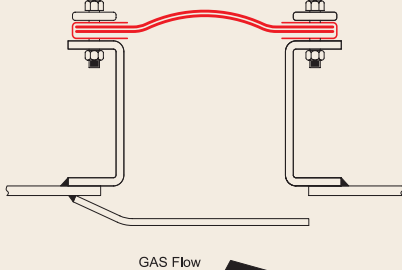

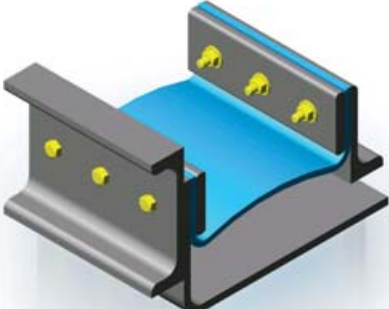

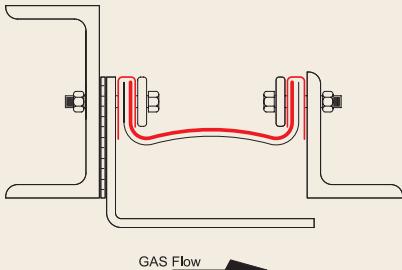

The active length of the flexible element is a major design consideration. When designing active length, both movements and system pressure must be considered.

### Back-Up Bar

- Composed of steel bar. Tightens the connection with belts and duct flanges or expansion joint structures
- Standard size Back-up Bars is 9mm thick and 50mm wide.
- All edges connected to flexible element should be grinded smooth or radiused so as not to damage the flexible element.
- Bolt hole spacing is standardized at 4 inch or 6 inch center-to-center distance.

Bolt Size	Flange Bolt Hole Spacing
1/2" bolt	4"
5/8" bolt	4" or 6"

Connection Method of the Product to Duct	Structure Features	
		<p><b>FF Type</b></p> <ul style="list-style-type: none"> <li>• Accommodates a flanged duct.</li> <li>• Same advantage as an "FW" type.</li> <li>• If bolting is necessary, holes matching the duct flange and welded nuts can be provided.</li> </ul>
		<p><b>FW Type</b></p> <ul style="list-style-type: none"> <li>• Best choice when liners are required.</li> <li>• Landing bar type fit permits duct misalignment.</li> <li>• Accommodates any flat belt selection.</li> <li>• Shipped fully assembled for easy installation.</li> <li>• Rectangular joints have full radius corners.</li> <li>• Low replacement cost of flexible element.</li> <li>• Best choice for attachment of fly ash barrier.</li> <li>• Flanges can act as duct stiffeners.</li> </ul>
		<p><b>WLW Type</b></p> <ul style="list-style-type: none"> <li>• Accommodates any flat belt selection.</li> <li>• Rectangular joints have full radius corners.</li> <li>• Shipped fully assembled, for easy installation.</li> <li>• Welded to ducts.</li> <li>• Liner welded at site.</li> </ul>
		<p><b>MC Type</b></p> <ul style="list-style-type: none"> <li>• Accommodates a flanged duct.</li> <li>• Bolting accessible from exterior of duct.</li> <li>• Liner is used selectively.</li> <li>• Economic installation cost.</li> </ul>

## System Temperature

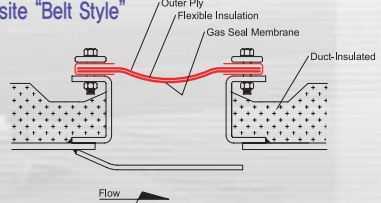

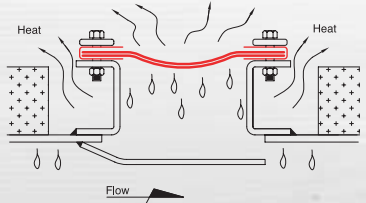

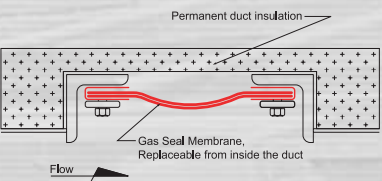

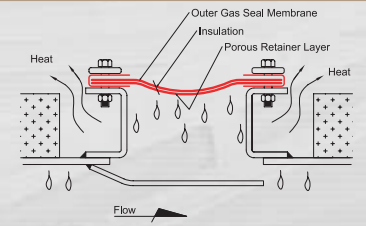

### Insulation and Condensation within the Ducting

High temperature ducting systems are often insulated to conserve energy and to prevent internal condensate. Expansion joint should be designed properly for this condition to avoid problems. The description below is an example of proper expansion joint and heat insulation design.

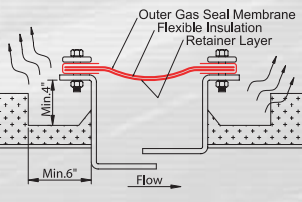

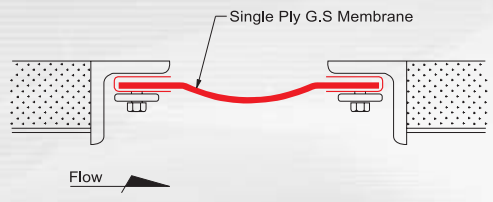

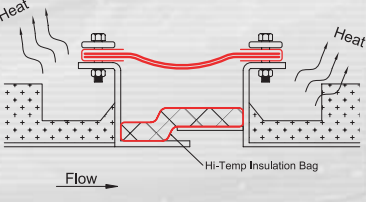

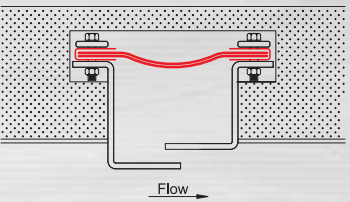

### Insulating Layers

The thermal barrier of a multi-layer fabric element must resist heat, moisture and acid attack. Additional retaining layers must be made of materials which remain strong and flexible when exposed to high temperatures and acids or condensates resulting from operation at or below the dew point.

**When the maximum continuous system, operating temperature is near the gas dew point and less than the allowable service temperature of the gas seal membrane material**

Good Design	Pool Selection Of Material Single Ply Seal Membrane
<p><b>Dew Point Composite "Belt Style"</b></p>  <p>Expansion joint flexible element is fully insulated to conserve energy, yet easily accessible for inspection and replacement.</p>	 <ul style="list-style-type: none"> <li>• Ducting and expansion joint are not properly insulated.</li> <li>• Severe condensation is possible. • Costly heat energy is lost.</li> </ul>
<p><b>Single ply "Belt style"</b></p> 	 <ul style="list-style-type: none"> <li>• Condensate infiltrates heat insulation material. • Heat loss.</li> <li>• Accelerated deterioration of fabric materials.</li> </ul>

**Operation temperature exceeds the minimum temperature of gas seal material**

Good Design Example	Pool Selection Of Material & Construction Ply
 <p>Minimizes heat loss and permits optimum cooling of gas seal membrane. Flanges standoff reduces the temperature of the belt and the critical attachment area, thereby maximizing service life.</p>	 <p>Gas seal membrane is exposed to full system temperature. Accelerates deterioration of gas seal membrane, as the flange is not cooled due to insulation.</p>
 <p>Inserting additional insulation to the space of the product properly lowers the temperature affecting bellows properly.</p>	 <p>Gas seal membrane and frame are unable to be cooled due to insulation. This causes deterioration of efficiency.</p>

## Insulation

When insulating the ductwork care should be taken to properly insulate around the expansion joint assembly. Low temperature expansion joints, (below 500°F), may be insulated over with the concurrence of the expansion joint manufacturer. High temperature expansion joints, (over 500°F) should not be insulated over. The connection point between the expansion joint element and the mounting frame should allow for adequate cooling.

The Connection of Expansion Joint and Duct Flange

Prevention of Fly Ash Accumulation

## Insulation Pillow

The insulation pillow fills the cavity between flexible element and the metal liner and helps prevent the accumulate matter, and in some applications unburned fuel, from becoming trapped in the expansion joint cavity. If there is no cavity pillow, fly ash or other solid particulates can accumulate in the expansion joint cavity in such quantities that they can cause damage to the flexible element if they solidify to a cementations state. Also, certain non-cementatious particles (fly ash) can create a severe corrosive (acidic) environment when subjected to cooling (below  $H_2SO_4$  dew point) during a maintenance outage.

# EXPANSION JOINT MATERIAL

The efficiency of non-metallic expansion joint applied to various kinds of gas duct systems depends on operating circumstances and materials used. You should select materials considering required functional specifics as well as temperature features and chemical performance. Material used in a corrosive environment may have a severe effect at high temperature though they do not show any abnormal changes within heat resistant temperature range. On the other hand, the system operated below dew point generates highly corrosive condensate.

The fabric used for reinforced of elastomers and other coating material requires a mechanical component that is flexible and strong for the

pressure and expansion of the duct system expansion joint. Moreover, this fabric material is used for the intermediate layer or heat insulation layer of composite type bellows, meeting the temperature conditions and chemical requirements of the ducting system.

You use insulating material to lower the contacting temperature in order to maintain satisfactory performance and the service life of elastomer or coated material used for seal membrane. Apply a fiberglass blanket for up to 540°F and a ceramic blanket for higher temperatures, but have mechanical and chemical limitations.

The following is a summary of general information, in accordance with each material's general features.

## Commonly Used Elastomers and Coating Materials for Expansion Joint

### 1) Neoprene (CR):

Oil resistant—not affected by oil, grease and other petroleum products. Weatherproof—resistant to ozone and weather, and advantageous for outdoor use. Resistant to impact from abrasion, expansion and torsion.

### 2) Ethylene propylene (EPDM):

These have high tensile strength and elongation, oxygen and ozone resistance, superior expansion, fine chemical resistance. Reinforced EPDM expansion joints have been used in power plants and industrial plants.

### 3) Fluoroelastomer (FKM):

Commonly called Viton. Chemical resistance, oil resistance and heat resistance are superior to other elastomers. These products generally do not require protection (sleeve) from flue gas media.

### 4) Silicone (SL):

Silicones have good resistant to ozone and weather, but poor resistance to flue gas constituents. Accordingly, the use of reinforced silicone products is limited to exterior covering for a hot air duct or low temperature composite joint.

### 5) Fluoroplastics:

Fluoroplastics are thermoplastic resins commonly called Teflon, such as PTFE or FEP. Used as film or coating for variety fabric. The film type product provides chemical resistance when laminated.

Laminated products are much more impermeable than coated products. Teflon-coated or laminated products require a protector as they have poor abrasion resistance.

Note.1) Above product codes are in accordance with the layer constitution followed by commonly temperature application

Note.2.) A cover material allows change, depending on fluid type and demands.

# INFORMATION ABOUT RUBBER EXPANSION JOINT

## Product Definition

Rubber expansion joint is flexible connector coefficient that is produced by reinforcing natural rubber or synthetic rubber with fiber or metal to release the piping stress caused by thermal and mechanical vibration and displacement in piping systems. Products have flexibility, absorb composite displacement, reduce noise and vibration and are consumption resistant to chemical abrasion.

## Functions

An engineer is able to solve vibration, noise, impact, corrosion, abrasion, stress and space problems by using a rubber expansion joint.

### 1) Reduce Vibration:

Rubber expansion joints reduce or isolate vibration caused by equipment. Some equipment demand more vibration control than others. For example, reciprocating pumps and compressors generate extensive and irregular force. Rubber expansion joints can decrease very loud noise and vibration produced by the vibration of a centrifugal pump or fan. This has been proved by practical experiments. Also, rubber expansion joints restrain and prevent vibration transfer.

### 2) Reduce Noise:

The abrasion caused by irregular operation of equipment and general aging such as corrosion and wear by steam can transmit noise around equipment. The rubber expansion joint reduces noise as it puts metal flanges in contact with rubber.

### 3) Compensate Lateral, Torsional and Angular Movements:

Pumps, compressors, fans, piping and related equipment move out of alignment due to wear, load stresses, relaxation and settling of supporting foundations. Rubber expansion joints compensate for lateral, torsional and angular movements—preventing damage and undue downtime of plant operations.

### 4) Compensation for Axial Movement:

Rubber expansion joints compensate for the extension and compression generated by thermal changes or hydraulic surge effects. This displacement is absorbed by the rubber expansion joint in a similar fashion to a helix spring application.

## Advantages

HKR has set a standard that meets clients and builder's expectations, considering various operational conditions, and manufactures and supplies products that meet this standard. Its products offer unique features by using synthetic rubbers and synthetic fabrics.

### 1) Minimal Face-to-Face Dimensions:

Maximum cost reduction, compared to expensive expansion bends or loops. Loop might cost less than pipe itself, but the total expense, including space, labor costs and supports, are much higher.

### 2) Lightweight:

No need to use special handling equipment. Lowers installation labor costs.

### 3) Low Movement Forces Required:

The inherent flexibility of rubber joints permits almost unlimited flexing to recover from imposed movements, requiring relatively less force to move, thus preventing damage to motive equipment.

### 4) Reduced Fatigue Factor:

The inherent characteristics of natural and synthetic elastomers are not subject to fatigue breakdown or embrittlement and prevent any electrical effects as they come in contact with flanges.

**5) Reduced Heat Loss:**

Loop type produces high operation costs due to the large amount of thermal loss though additional piping used for while transferring fluid. On the other hand, rubber expansion joints reduce thermal loss and are operated for long periods without maintenance or repair.

**6) Corrosion, Erosion Resistance:**

The rubber expansion joint can be composed of various kinds of natural rubber or synthetic rubber and fabrics, and be manufactured to meet each pressure and temperature condition and to withstand the effects of corrosion and abrasion. TFE/FEP lining structures are available as needed.

**7) No Gasket:**

As tubes and flanges are produced in one body, an additional gasket for connection is not required. Though the pipe flange is not flat, the flange of the rubber expansion joint can equalize the sealing of fluid.

**8) Noise Reduction:**

The rubber expansion joint reduces the noise and vibration of piping.

**9) Greater Shock Resistance:**

The rubber expansion joint can withstand against the shock stress caused by excessive hydraulic surge, water hammers or pump cavitation.

## Construction Details

**1) Tube:**

Lined with synthetic or natural rubbers to prevent leakage. Manufactured seamless from the inside to the end of a flange. Prevents holes in the body or weakening of fabric. These tubes can be designed to cover service conditions for chemical petroleum, sewage, gaseous and abrasive materials.

**2) Cover:**

Outer surface composed of synthetic or natural rubbers protects the frame from damage or severe conditions.

Special polymer is resistant to oil, sunlight, acid fumes and ozone, and it is additionally coated to protect the exterior surface.

**3) Carcass:**

The carcass or body of the rubber joint consists of fabric and, when necessary, metal reinforcement.

- **Fabric reinforcement:** Maintains tube and cover, being flexible. Made of fine quality synthetic fabric, but occasionally natural fabric used within acceptable temperature and pressure conditions. All fabric plies are impregnated with rubber or synthetic compounds to permit flexibility between the fabric plies.

- **Metal reinforcement:** Wire or solid steel rings maintain the rigidity of the joint, being inserted into the body. It extends the operational pressure range and ensures the product's rigidity in vacuum service.

Figure : Corss Sectional View Of Standard Spool "Arch" Type Expansion Joint

# T TYPE OF RUBBER EXPANSION JOINTS

## SPOOL TYPE

A full face integral flange design is available in both Single Arch and Multiple Arch Types. These basic types can be manufactured to meet the requirements of the related Code and Standards. These types are available in several construction design series, based on the application pressure requirement.

### 1) Single Arch Type:

Consists of fiber and rubber reinforced with metal rings or wire. Joint body and flange are in one body. Has same type of bolt holes as the metal flange of the pipe to be connected. The rubber flange is designed to be thick enough to avoid leakage without a gasket for connecting the other flange. Allows minimum face-to-face dimensions.

### 2) Multiple Arch Type:

Applied where a larger movement is required compared to single arch. Each arch of multiple arch type is able to absorb the same movements as one arch of single arch type does. Minimum length is in proportion to arithmetic, and maintains lateral stability and the joint installed horizontally generally requires a maximum of four scenes to prevent loosening.

### 3) Reducer Type:

Applied when each side has a different diameter. Have two types: "Concentric Type" (both pipes have the same central axis line) and "Eccentric Type" (having the axis of each end offset from each other). Taper angle does not exceed 15°.

### 4) Filled Arch Type:

It fills a gap by inserting soft rubber into the inside gap, preventing separation of the rubber while operation. Movements of expansion joints with filled arches are limited to 50% of the normal movements of comparable size of expansion joint with unfilled (open) arches.

**5) Offset Type:**

Manufactured by request of client in the case of non-identical piping axis line. Occasionally used where it is difficult to compensate for the lineup errors.

**DOG-BONE TYPE BELT**

A molded construction of plies of rubber-impregnated fabric, rubber covered and spliced endless, to a specified peripheral dimension. Used as a flexible connection in central power stations on condensers. Designed for compression and lateral movements for full vacuum service and maximum pressure of 15 psig. Must be used with special clamping devices.

**RETAINING RING AND CONTROL UNITS**

**1) Retaining Ring:** Retaining rings must be used to distribute the bolting load and assure a pressure tight seal. They are coated for corrosion resistance and drilled as specified. The rings are installed directly against the back of the flanges of the joint and bolted through to the mating flange of the pipe. Ring has a thickness of 10mm, but can be used according to conditions. Ring in interior that is connected to rubber flange is round to avoid damage to the rubber.

**2) Control Unit Assembly:** Install a suitable control unit in accordance with designed pressure conditions. It protects the product against excessive expansion of pipes, and as it is not designed to reinforce the anchor of pipes, this should be clearly indicated. Because of the direct installation of the pump flange, the back should be allowed sufficient space, considering installation length of bolt, nut and washer as well as the space for the plate.

# OPERATIONAL FEATURE OF RUBBER EXPANSION JOINT

## EXPANSION JOINT MOVEMENT

- 1) **Axial Compression:** Shortening displacement of distance, face-to-face
- 2) **Axial Elongation:** Lengthening displacement of distance, face-to-face
- 3) **Lateral Movement:** the movement or relating displacement of the two ends of the joint perpendicular to its longitudinal axis.
- 4) **Vibration:** Flexible connector absorbs the mechanical oscillations of the system. Usually high frequency.
- 5) **Angular Movement:** The angular displacement of the longitudinal axis of the expansion joint from its initial straight line position, measured in degrees. This is a combination of axial elongation and axial compression.
- 6) **Torsional Movement:** The twisting of one end of an expansion joint with respect to the other end about its longitudinal axis. Such movement is measured in degrees.
- 7) **Concurrent Movement:** the combination of two or more of the above expansion joint movements. This value is expressed as the resultant movement.

## OPERATING TEMPERATURE RANGE

The types of rubbers and reinforced fiber materials are generally classified by temperature.

Type of Elastomer	CLASS	Type of Fabric	CLASS
Gum Rubber	Std.I	Cotton	Std.I
Natural Rubber	Std.I	Rayon	Std.I
SBR/GRS/Buna-S	Std.I	Nylon	Std.II
Neoprene	Std.II	Polyester	Std.III
Buna-N/Nitrile	Std.II	Fiberglass	Std.III
Hypalon®	Std.II	Kevlar	Std.III
Butyl	Std.II	Nomex	Std.III
Chlorobutyl	Std.III		
EPDM	Std.III		
Viton®/Fluorel®	Std.III		
Silicone	Std.III		
Teflon®/TFE/FEP	Std.III		

STD I : Recommended up to 180°F  
 STD II : Recommended up to 230°F  
 STD III : Recommended for over 230°F  
 (Note: Each material has different temperature limits.)

# OPERATIONAL FEATURE OF RUBBER EXPANSION JOINT

## EXPANSION JOINT MOVEMENT

- 1) **Axial Compression:** Shortening displacement of distance, face-to-face
- 2) **Axial Elongation:** Lengthening displacement of distance, face-to-face
- 3) **Lateral Movement:** the movement or relating displacement of the two ends of the joint perpendicular to its longitudinal axis.
- 4) **Vibration:** Flexible connector absorbs the mechanical oscillations of the system. Usually high frequency.
- 5) **Angular Movement:** The angular displacement of the longitudinal axis of the expansion joint from its initial straight line position, measured in degrees. This is a combination of axial elongation and axial compression.
- 6) **Torsional Movement:** The twisting of one end of an expansion joint with respect to the other end about its longitudinal axis. Such movement is measured in degrees.
- 7) **Concurrent Movement:** the combination of two or more of the above expansion joint movements. This value is expressed as the resultant movement.

## OPERATING TEMPERATURE RANGE

The types of rubbers and reinforced fiber materials are generally classified by temperature.

Type of Elastomer	CLASS	Type of Fabric	CLASS
Gum Rubber	Std.I	Cotton	Std.I
Natural Rubber	Std.I	Rayon	Std.I
SBR/GRS/Buna-S	Std.I	Nylon	Std.II
Neoprene	Std.II	Polyester	Std.III
Buna-N/Nitrile	Std.II	Fiberglass	Std.III
Hypalon®	Std.II	Kevlar	Std.III
Butyl	Std.II	Nomex	Std.III
Chlorobutyl	Std.III		
EPDM	Std.III		
Viton®/Fluorel®	Std.III		
Silicone	Std.III		
Teflon®/TFE/FEP	Std.III		

STD I : Recommended up to 180°F  
 STD II : Recommended up to 230°F  
 STD III : Recommended for over 230°F  
 (Note: Each material has different temperature limits.)

# STANDARD PRODUCT

## BASIC STRUCTURE OF STANDARD PRODUCT SPOOL

Composition		Use
Name	Material	
Tube	RUBBER	Prevention of fluid leakage
Cover	RUBBER	Protection of exterior/Weather resistance
Reinforced Fabric	SYNTHETIC FIBER	Formation of product
Steel Wire	CARBON STEEL	Formation/reinforcement of pressure
Steel Ring	CARBON STEEL	Formation/reinforcement of pressure
Retaining Ring	CARBON STEEL	Maintenance of flange/Dispersion of bolting load

## USING TEMPERATURE

Rubber Type		Symbol	Maximum Operational Temperature(°F)
Inside Tube	Outside Cover		
BUTYL	BUTYL	BB	250
EPDM	EPDM	EE	350
HYPALON	HYPALON	HH	225
HYPALON	NEOPRENE	HN	225
NITRILE	NEOPRENE	NE	210
NEPORENE	NATURAL	NT	180
VITON	VITON	VV	400

- Note 1) Above movement is decreased by 50% with the filled arch type.
- Note 2) Each movement value is the angle in maximum extension condition.
- Note 3) Multiple arch type movement is calculated as; above movement amount x number of arches
- Note 4) Contact HKR to inquire about force & spring rate.

# INSTALLATION

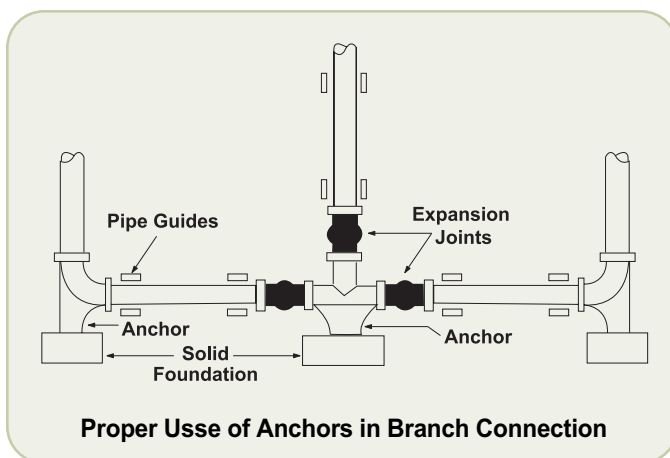

It can be stated generally that the proper location of rubber expansion joints is close to a main anchoring point. Following the joint in the line, a pipe guide or guides should be installed to keep the pipe in line and prevent undue displacement of this line.

## ANCHOR AND GUIDE OF PIPING SYSTEM

### 1) Anchors Are Required:

Observe the simple piping system example above. The piping should be careful to finish the section where pipe direction is changes or joint is installed with solid foundations. This joint is able to maintain the original layout of pipes through the use of an additional guide. The pump base, blocking the pipe thrust transferred through pump flanges, supports the elbow near pump safely. The solid foundations installed at 90° and 45° are designed firmly to withstand pipe thrust and force.

### 2) Thrust Calculation:

Thrust is generated by maximum pressure (design/test) of pipes and arch of a product.

### 3) Branch Connection Anchors:

The picture at left shows how to install an anchor with branch connection. In designing an anchor, consider all the forces that affect the connecting part of the tee section and the elbow part. Indicate that a guide or anchor is required in the installation section of the joint.

## CONTROL UNIT

### 1) Definition and Purpose:

Designed to prevent damage to the product by connecting more than two control rods (tie rods) from the flange on one side to the flange on the other side. Extreme movement of piping may cause damage to pipe line or other devices. The control rod fixes the product within the allowed extension and compression range, and absorbs the thrust created by the pressure in a joint. Adding such safety materials minimizes the possibility of damage to a product and devices. Control units will adequately protect the joints, but the user should be sure that pipe flange strength is sufficient to withstand total force that will be encountered.

### 2) Use in Restraining the Piping System:

Control units may be required to limit both extension and compression movements.

**a. Extension:** Necessary when an appropriate anchors cannot be installed. In this case, the thrust created by pressure is extended to the control rod that is set to avoid excessive extension. Use control rods when you are unable to install a suitable anchors.

Joint can never be too strong, considering the fact that an anchor absorbs the essential thrust of pipes. Ignoring these principles can cause the early damage of a joint.

**b. Compression:** You can install a pipe sleeve over the control rod. Its purpose the prevent on of excessive compression of the joint. Select the pipe sleeve length, so as not to allow it to reduce greater than the compression range of joint.

**c. Specifics:** Number and size is chosen by installation pressure or test pressure. Indicate the flange thickness if a control unit is required.

### d. Use Example of Control Rod:

Picture shows a case where an anchor cannot be used. The anchor point at the upper 90° elbow in the discharge line has been eliminated. In this situation, it is necessary to employ properly designed control units with the joints located in this non-anchored line. If a control unit is not used, the pipe at the elbow 45° from the pump moves excessively through the elongation of expansion joint.

The expansion will keep proceed until the expansion joint is destructed. The control unit enables the pipe between the anchor and pump to the 45° elbow to be lengthened. Though each pipe is compressed, it is impossible for a joint to be expanded by the control unit, exceeding the set expansion range.

## PRECAUTIONS INSTALLATION

### 1. SERVICE CONDITIONS

Check the temperature, pressure, vacuum and movement conditions of a joint. If the required condition of the system does not meet the joint's use range, adjust it by consulting the manufacturer. Be aware of the chemical problems resulting from elastomer applied to fluid or gas.

### 2. ALIGNMENT

The expansion joint is not usually taken into account in the compensation value for piping misalignment errors. Therefore, pipe should be arranged within the error value, 1/8". Failure to properly arrange pipes decreases the expansion absorption capacity and causes extreme stress, consequently lowering the product's service life. The pipe guide assists in the alignment of pipes and prevents severe displacement.

### 3. ANCHORING

Solid anchoring is required at both sides of a joint where the piping direction is changed. If not, these may be extreme movement of a joint, resulting in damage.

### 4. PIPE SUPPORT

Piping must be supported so expansion joints do not carry any pipe weight.

### 5. MATING FLANGE

Install a joint at the mating flange, and ensure the head of the bolt and washer meet the retaining ring. Face to face distance is the same as the pipe's installation space. Check that the contact point of the mating flange is clean and flat. Do not allow the raised face to protrude more than 1/16". Avoid using a split retaining rings next to wafer-type check valve or butterfly valve.

### 6. TIGHTENING BOLTS

Tighten bolts in stages by alternating around the flange. To tighten a rubber-surface flange, the side of the flange should bulge slightly between the retaining ring and the flange. Torque bolts sufficiently to assure leak-free operation at hydrostatic test pressure.

### 7. STORAGE

A dry and cool warehouse is recommended. Lay the flange side onto a palette or wooden board, and avoid placing other objects on the joint. Expected product life under ideal storage conditions is about 10 years. For outdoor storage, place the flange side onto a wooden board, not directly on the ground, covering it with a waterproof canvas such as tarpaulin.

### 8. LARGE JOINT HANDLING

Do not insert rope or rods into the bolt holes to lift it up. Use a pad or wooden support to disperse the weight when using an interior hole. Be careful not to allow a forklift truck leg to touch rubber side directly. Do not put pressure on the flange side edge during transportation or handling.
